## **ABSTRACT**

This invention relates to a folding ramp for vehicle access, made up of two frames (5 and 6), linked to one another by means of a hinge (7) and with the door frame through a hinge (8), which frames can shift between a folded position, folded upon the door, and a deployed position, each frame being made up of two longitudinal beams (15 and 16) and an intermediate floor formed by a moving section (17) and at least one fixed section (18), the moving section (17) being able to shift between a position superimposed with the fixed section (18) and another extracted position, in which it is extended with said fixed portion (18).
